Assignment No: 19

Problem Statement: Create Structure EMPOLYEE for storing details. Define function members to compute a) Total number of employees in an organization b) Count of male & female empolyee c) Empolyee with salary more than 10,000 d) Empolyee with designation "Asst Manager".

Objective:

- To understand the use of structures in C programming
- To store & manage employee records using structures.
- To perform operations such as counting and filtering empbyee data.

Theory: In the C programming language, a structure is a user-defined data type that groups related variables of different data types under a single name. Structures are widely used for representing records such as empolyee information.

Platform: Linux

Input: Empolyee details such as Name, Designation, Gender, Date of Joining and Salary.

Output: Displays total number of empolyees, count of male & female empolyees, employees with salary greater than 10,000 and empolyee with.

Date / /

designation 'Asst Manager'.

Sample Input: Enter a number of empolyee : 2
Empolyee 1: Ravi, Asst Manager, Male, 12-00-2025, 15000

Empolyee 2: Anita, Klerk, female, 10-01-2023, 8000.

Sample Output: Total no. of empolyees = 2
Male empoly loyee = 1.
Female employee = 1
Employees with salary more than 10000 : Ravi.
Employee with designation Asst Manager: Ravi

Conclusion: Thus, the C program sucessfully demonstrates the use of structures to store empolyee details and perform various operations such as counting employee, identifying.

FAQs:

1) How does a structure in C programming language help in organizing multiple related data items such as empolyee details?

A. a) A structure in C helps organize multiple related data items by allowing you to group different types of variables under one name.
b) It makes code clean & easy to understand.
c) Improves data management and readability.

2) Why are structures preferred over simple variables or arrays when managing records like employee information?

DOMS Page No.
Date / /

A. a) Grouping of different data types

```
struct Employee {
    int id;
    char name[50];
    float salary;
}
```

b) Better data organization.
All details of one employee are in one place
Makes program easy to read & understand.

c) Easy handling of multiple records.

```
struct Employee emp[10];
```

3) How can conditional statements and functions be used with structures to filter employees based on salary or designation?

A. Conditional statements are used to check conditions like salary or designation, and functions are used to process structure data, allowing efficient filtering of employee records based on specific criteria.
