Assignment No: 22

Problem Statement: Write a menu driven program in C to perform various string operations using in-built functions.

Objective:
- To understand the concept of strings in C programming language.
- To learn how to use built-in string functions for string manipulation.
- To perform operations such as length calculation, copying, concatenation, comparison, and reversal using menu options.

Theory: In the C programming language, a string is a sequence of characters terminated by a null character ('\0'). Strings are stored in character arrays and manipulated using functions available in the string.h header file.

Platform: Linux

Input: Two strings entered by the user

Output: Displays results of different strings operations such as length, copy, concatenation and comparison.

Sample Input: Enter first string: Hello
Enter second string: World
Choice: 3

Sample Output:
Concatenated string : Hello World.

Conclusion: Thus, the C program successfully demonstrates different string operations using built-in functions through a menu driven approach, making the program interactive and easy to use.

FAQs:

1) What are built-in string functions in C and why are they used?

A. a) Built-in string functions in C are predefined functions used to perform operations on strings easily.

b) Since, C does not have a separate string data type, these functions help simplify string handling.

Why they are used:
1) Save time (no need to write logic from scratch)
2) Reduce errors.
3) Make code shorter & easier to understand.

2) What is the purpose of the string.h header file in C programs?

A The <string.h> header file contains declarations of all strings handling functions.

Purpose:
1) provides access to built-in string functions like strlen(), strcpy(), strcmp() etc.

2) Allows the compiler to recognize these functions.
3) Ensures proper usage and avoids errors during compilation.

3) How does a menu-driven program improve user interaction in programming?

A. a) Makes program user-friendly.
b) Easy to understand and navigate.
c) Reduces user confusion.
d) Allows repeated operations without restarting the program.
e) Organizes complex tasks into simple choices.
