Assignment No: 21

Problem Statement: Write a C program to copy content of one file to another using file handling.

Objective:
To understand the concept of file handling in C programming language.
To learn how to read data from a file and write data into another file.

Theory: File handling in the C programming language allows programs to store and retrieve data from files. The program reads characters from the source file one by one using fgetc() and writes them to the destination file using fputc().

Platform: Linux

Input: A source file containing text data.

Output: Contents of the source file copied into another file.

Sample Input:
source.txt
Hello
Welcome to C programming

Sample Output:
File copied successfully.

Destination file destination.txt will contain:
Hello
Welcome to C Programming.

Conclusion: Thus, the C program successfully demonstrates file handling operations by copying the contents of one file into another using file handling function.

FAQs:

1) What is file handling in C programming & why is it important?

A. File handling in C means performing operations (like create, read, write, append) on files stored on disk using functions from <stdio.h>.
a) Stores data permanently.
b) Handles large data efficiently.

2) What is the purpose of fopen() and fclose() functions in file operations?

A. a) fopen() is used to open a file. Returns a pointer of type FILE *.
b) fclose() is used to close an opened file. Saves data properly.

3) How does the program detect the end of a file using EOF? (End of File)

A. a) EOF is a special value used to indicate the file has no more data to read.
b) Functions like getc(), fgetc() or fscanf() return EOF when the end is reached.
